

Fitting a basket rail to an Island Freezer

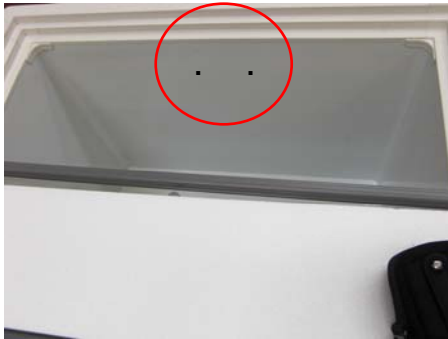

These instructions relate to the following freezers:

- Wall's Take Home Island 150
- Wall's Take Home Island 200
- Wall's Take Home Island 250
- VT150 Island Freezer
- VT200 Island Freezer
- VT250 Island Freezer

The kit for this consists of 1 x rail, 2 x brackets and 4 x self tapping screws

On the inside of the freezer at both ends, in the centre approximately 25mm down from the plastic breaker frame, there are two indentations that require drilling with a 1/8th drill (it is safe to drill in these areas but nowhere else – the indentations that need drilling through are approximately 2mm thick and there is no need to drill any further into the freezer side than this 2mm).

Indents where circled

Drill the two indents

With the four holes drilled secure the brackets with the cutouts facing up with the four screws provided. Locate the basket rail into the cutouts on the brackets. The baskets can be placed into position between the rail and breaker frame.

Secure the bracket with the screws supplied

Secured

When both brackets are done the rail can be inserted and baskets placed

Please note that this must be undertaken only by a competent person and by following this guide you are doing so at your own risk. Total Refrigeration Ltd cannot be held responsible for any damage caused to the freezer. If you have any questions contact Total Refrigeration Ltd on 0845 127 2527
